

DocDock Azure Blob Storage Guide

SECURE AZURE BLOB CONNECTION

This guide explains how to set up a Microsoft Azure Storage Account and Blob Container for DocDock integration.

Configuration Checklist

By following this guide, you will collect and fill in the 3 required variables for your JSON config:

- **accountName**: The unique name of your Azure Storage Account.
- **containerName**: The specific container inside the storage account.
- **accountKey**: The secret access key used to authenticate the connection.

Step 1: Create or Select an Azure Storage Account

1. Log in to the **Azure Portal** (portal.azure.com).
2. Search for and select **Storage accounts** from the global search.
3. Click **+ Create** to build a new account, or click on an existing storage account.
4. Note down the name of the storage account. **(Collect as "accountName")**.
5. Follow the wizard to deployment if creating a new one (Standard performance and LRS are typical defaults).

Step 2: Create the Blob Container

1. Inside your Storage Account dashboard, navigate to the left sidebar menu.
2. Under the *Data storage* section, click on **Containers**.
3. Click the **+ Container** button at the top.
4. **Name**: Enter a name for your container. **(Collect as "containerName")**.
5. **Public access level**: Keep this set to **Private (no anonymous access)** to keep your data secure.
6. Click **Create**.

Step 3: Retrieve the Account Access Key

1. Go back to your main Storage Account view.
2. In the left sidebar menu, scroll down to the *Security + networking* section and click **Access keys**.
3. Click the **Show** button next to **Key 1** (or Key 2).
4. Copy the long string listed under **Key**. **(Collect as "accountKey")**.

Step 4: Final DocDock Configuration JSON

Populate your configuration template with the collected Azure values:

```
{
  "name": "sampleAzureBlob",
  "config": {
    "containerName": "your-container-name",
    "accountName": "your-account-name",
    "accountKey": "your-account-key"
  }
}
```

 **WARNING:** Keep this final JSON configuration strictly confidential. Your Azure accountKey grants full root access to the storage account data. Never commit it to public repositories or share it over insecure platforms.
