

DocDock Local API Documentation

DocDock local API allows developers to programmatically submit local document files or links for remote documents to be processed by user's chosen AI models (Gemini or GPT). It parses document structures against picked schema defined by user on DocDock platform and returns cleanly structured JSON results.

Dynamic Port Allocation: DocDock as a local application, has its port dynamically assigned on startup. Users can locate the active port directly from the "account dashboard" on DocDock's desktop app. Access the API via your current active port.

API Endpoint Reference

POST `http://localhost:<PORT>/convert`

Query Parameters

PARAMETER	TYPE	REQUIRED	DESCRIPTION
workspace	String	Required	Target workspace and template for your document as in DocDock desktop app.
template	String	Required	
file_path	String	Required	Absolute local file path (e.g. C:\path\doc.pdf) OR a public remote URL (HTTP/HTTPS).

Rate Limit

- **Non-Pro Users:** 1 active conversion at a time.
- **Pro Users:** Unlimited parallel batch conversion.

Python Integration Example

The Python script below demonstrates scanning a list of local file paths and online file links using DocDock conversion API.

```
import requests

PORT = "3000"
WORKSPACE = "YOUR_WORKSPACE"
TEMPLATE = "YOUR_TEMPLATE"
file_paths = [
    "C:\\Users\\JohnDoe\\Desktop\\test.pdf",
    "https://s3-eu-west-2.amazonaws.com/example-bucket/live_sample.jpg"
]
for file_path in file_paths:
    print(f"PROCESSING: {file_path}")
    try:
        response = requests.post(
            f"http://localhost:{PORT}/convert",
            params={
                "workspace": WORKSPACE,
                "template": TEMPLATE,
                "file_path": file_path,
            }
        )
        if response.status_code == 200:
            print(f"==> RESULT: {response.json()}")
        else:
            print(f"==> API ERROR [{response.status_code}]: {response.text}")
    except requests.RequestException as e:
        print(f"==> CONNECTION ERROR: {e}")
```

Error Code Matrix

HTTP STATUS	ERROR CODE TEXT	ROOT CAUSE / RESOLUTION
400	NO_FILE_PROVIDED	file_path missing
400	LOCAL_FILE_READ_FAILED	Failed to read local file. Check file path formatting and file access permissions.
400	ONLINE_FILE_FETCH_FAILED	Remote URL returned a non-200 status when being downloaded by the backend.
429	NON_PRO_LIMIT_1	Concurrency limit breached for free tiered user.

HTTP STATUS	ERROR CODE TEXT	ROOT CAUSE / RESOLUTION
404	TEMPLATE_NOT_FOUND	The requested combination of workspace and template does not exist.
403	NO_ACTIVE_API_CREDENTIAL	No LLM provider keys (Gemini / OpenAI) have been selected or activated inside DocDock settings.
422	MODEL_OUTPUT_INVALID	The AI engine executed successfully, but its response failed DocDock schema validation.
